Purpose of Thesis

- Why is this work important?
- Who will benefit from it?

Research Question

Is there a significant performance difference between implementations of a Fast Fourier Transform (FFT) in native code, compiled by Clang, and Dalvik bytecode, compiled by Android Runtime, on Android?

Android development

- Android Software Development Kit (SDK)

Android development

- Android Software Development Kit (SDK)
- Android Runtime

Android development

- Android Software Development Kit (SDK)
- Android Runtime
- Android Native Development Kit (NDK)

Android development

- Android Software Development Kit (SDK)
- Android Runtime
- Android Native Development Kit (NDK)
- Java Native Interface (JNI)

Vectorization

(a) Four separate instructions

(b) One instruction with SIMD

- SSE
- NEON

Discrete Fourier Transform (DFT)

- DFT: *Time* \Rightarrow *Frequency*
- Decomposition of a signal
- Example uses:
 - ▶ Audio visualization
 - ▶ Speech recognition
 - ▶ Compression
- Fast Fourier Transform (FFT)

Experiments

- ① Cost of using JNI
- ② Comparison of smaller FFT libraries
- ③ Native optimization with NEON

Implementation

- **Java**

- ▶ Princeton Recursive
- ▶ Princeton Iterative
- ▶ Columbia Iterative

Implementation

- **Java**

- ▶ Princeton Recursive
- ▶ Princeton Iterative
- ▶ Columbia Iterative

- **C++**

- ▶ KISS (Keep It Simple Stupid) FFT
- ▶ SSE Recursive FFT
- ▶ SSE Iterative FFT

Implementation

- Benchmark application
- Separate thread, one algorithm at a time
- 100 executions, 95% confidence interval

JNI (Time μ s)

- Overhead not significant
- JNI implementation differ between VMs
- Previous studies have reported larger execution times
- Resolution of Java Timer

Libraries (Java)

Table: Java line graph for *large* block sizes with standard deviation error bars

Libraries (C++)

Figure: C++ line graph for *large* block sizes with standard deviation error bars

Libraries

- Recursive algorithm worst
- Princeton algorithms allocates during run loop
- Java Columbia Iterative comparable with C++
- Translating Java \rightarrow C++

Figure: NEON results table for *extra large* block sizes, Time (ms)

- Vectorization is clearly faster
- Columbia Iterative diverges for larger block sizes
- Vectorization tests require some setup

Conclusions

Conclusion 1

The overhead from JNI does not have a significant effect on performance.

Conclusion 2

Of the tested algorithms, choose Columbia Iterative.

Conclusion 3

Avoid allocating memory in the run-loop of a recurring task.

Conclusion 4

NEON optimization is significantly faster than non-optimized code for larger block sizes.
